Slide 1 of 7

Project Background

The San Isidro waterfront includes a variety of public and private areas with different levels of accessibility. Understanding how these spaces are distributed helps provide an overview of the current relationship between the city and its riverfront.

Slide 2 of 7

Study Area

The study covers the San Isidro waterfront in the northern metropolitan area of Buenos Aires. All riverside areas were manually digitized and classified according to their accessibility.

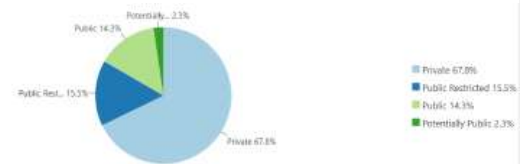

Slide 3 of 7

Accessibility Categories

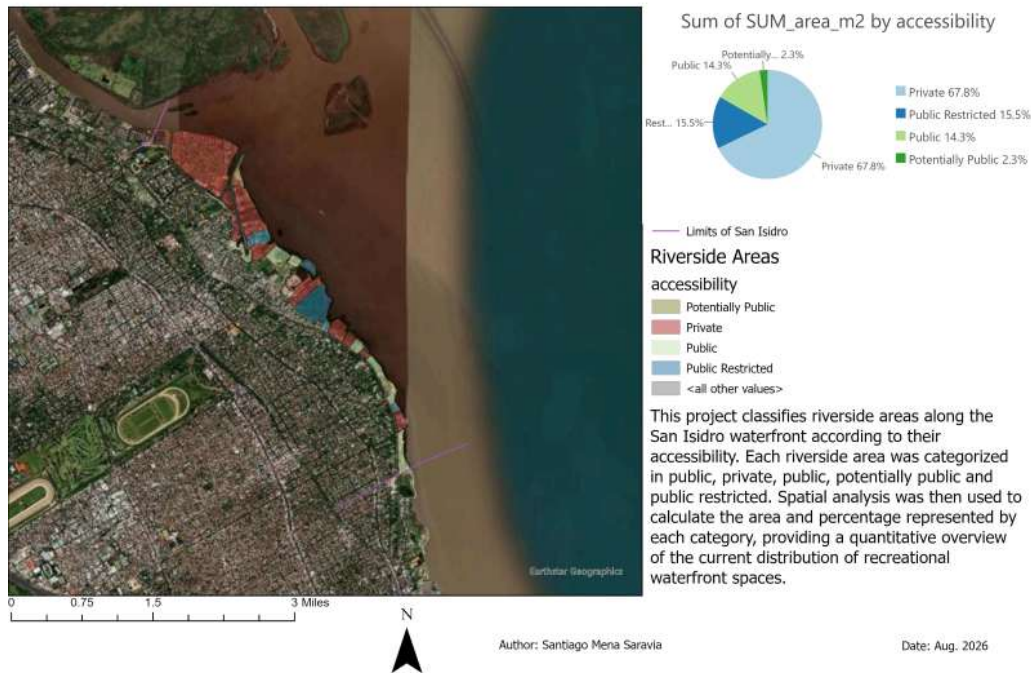

Category	Description
Public	Open public spaces accessible without restrictions.
Private	Residential or private properties with no public access.
Public Restricted	Public institutions or facilities with controlled access.
Potentially Public	Areas that could become public spaces in the future.

Results

Spatial analysis was used to calculate the surface area occupied by each accessibility category.

Classification of riverside land use in San Isidro.

Slide 6 of 7

Conclusions

This analysis shows that only **15%** of the riverside area is currently accessible as public recreational space, with an additional **2%** planned for future public use. Meanwhile, **nearly 70%** remains private, highlighting that despite the Municipality of San Isidro's efforts to improve waterfront accessibility, significant progress is still needed.
